

MyRX × Samsung Health Data SDK — Data Flow

Northern Princess LLC · myrxfit.com · May 18, 2026

Data flow

1. Galaxy Watch
↓ *Bluetooth Low Energy (paired)*
Captures heart-rate, workout, and sleep data on-device.
2. Samsung Health app (Galaxy phone)
↓ *Samsung Health Data SDK (Android, read-only)*
Stores the user's health data locally and syncs to the user's Samsung account.
3. MyRX Android app (package: com.myrx.app)
↓ *HTTPS over TLS 1.3, authenticated session*
Requests read-only access to the seven data types listed below; user grants consent via Samsung Health's native permission UI.
4. Supabase Postgres (per-user rows, RLS-scoped, AES-256 at rest)
↓ *Server-side compute*
Caches the latest fetched values keyed to the authenticated MyRX user; deleted on user disconnect.
5. MyRX cardio coaching engine
Generates personalized prescriptions in the Endurance, Threshold, and VO2 Max zones using Daniels' formulas and the user's actual best paces / HR.

Data types read (read-only, all from Samsung Health on the paired phone)

Heart rate	Anchors Endurance / Threshold / VO2 Max cardio zones; confirms target intensity during workouts.
Exercise with location	Workout type, duration, distance, intensity profile, GPS-derived pace and elevation. Core input for cardio training-history analysis.
Sleep	Sleep duration feeds the recovery score that gates harder training days. Used as a signal only; MyRX does not prescribe sleep itself.
Steps	Daily activity baseline used to differentiate sedentary days from active-rest days when scheduling sessions.
Activity summary	Aggregated daily activity used in recovery and training-load balance calculations.
Body composition	Weight and body-fat percentage used to compute lean body mass, BMR, and bodyweight-relative strength prescriptions (e.g., assisted pull-up % of bodyweight).
User profile	Height, weight, age, sex - required to compute personalized targets such as max HR, projected paces, and energy expenditure.

Data types written

None. MyRX v1 does not write any data to Samsung Health. The integration is strictly read-only.

Privacy commitments

All data fetched from Samsung Health is (a) read-only and read on demand — not bulk-mirrored; (b) encrypted at rest in Supabase Postgres with AES-256 and scoped per user via Row-Level Security; (c) never sold, never shared with third parties, never used for advertising; (d) deleted from MyRX's backend the moment the user taps Disconnect in Settings → Connect, at which point MyRX also revokes its Samsung Health SDK access via the de-registration endpoint.
